Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

Claim 5; SEQ ID NO 2; 46pp; English.

The present invention relates to a method for detecting RNA polymerase estivity in a continuous-read manner. The method comprises contacting an RNA polymerase with an oligonucleotide template in a reaction mixture comprising an assay buffer, under conditions in which the RNA polymerase

```
ô
is active, adding a fluorescent dye capable of binding double-stranded nucleic acid molecules to the reaction mixture, and measuring the fluorescence of the reaction mixture. The RNA polymerase is the Hepatitis C virus (HCV) polymerase, NSSB. The method is useful for treating HCV infection, bone mineral diseases like osteoporosis, carcinomas, acatiovascular diseases, diabetes, ocular disorders, renal dysfunction, lymphomas, lymphoproliferative disorders, metabolic disorders, arthritis, sleep disorders and thyroid disorders. The present sequence represents full-length HCV NSSB polymerase (designated FL NSSB).
                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                  180
                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                420

The present invention relates to a method for detecting RNA polymerase activity in a continuous-read manner. The method comprises contacting an RNA polymerase with an oligonucleotide template in a reaction mixture comprising an assay buffer, under conditions in which the RNA polymerase is active, adding a fluorescent dye capable of binding double-stranded nucleic acid molecules to the reaction mixture, and measuring the fluorescence of the reaction mixture. The RNA polymerase is the Hepatitis C virus (HCV) polymerase, NSSB. The method is useful for treating HCV infection, bone mineral diseases like osteoporosis, carcinomas, cardiovascular diseases, diabetes, ocular disorders, renal dysfunction, lymphomas, lymphopoliferative disorders, metabolic disorders, arthritis, sleep disorders and thyroid disorders. The present sequence represents C terminally truncated HCV NSSB polymerase (designated Cdeltazl NSSB).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

                                                                                                                                                         540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The polypeptide is that encoded by the full cDNA sequence of Korean hepatitis C virus (KHCV) cDNA, KHCV-LBCI. It or its fragments may be used in a specific and accurate method for detecting KCHV antibodies in the serum of hepatitis C patients. Antibodies directed against these polypeptides are useful for the purification of KCHV antigens and for the development of an improved diagnostic to detect KHCV antigens in a sample. The polypeptides may also be used in a vaccine for treatment and prevention of KHCV infection at a dosage of $2.200 ug/peptide. (Updated on 25-MRR-2003 to correct PN field.) RRARD) activity or the terminal molectidy! transferase (RMESE) activity encoded by hepatitis C virus (HCV), is characterised in that sequences concerned by hepatitis C virus (HCV), is characterised in that sequences concerned by hepatitis C virus (HCV), is characterised in that sequences content of the activities of RARD and TYMESE encoded by HCV in order to vitro the activities of RARD and TYMESE compounds that inhibit these carymatic activities and therefore might interfere with the replication of the HCV. The present sequence comprises amino acids 2420-3010 of the HCV DOLYprotein and corresponds to the NSSB protein. cDNA encoding this protein was cloned between the BamHI and HindIII sites of pBlueBacIII to form pBacSB. Another expression plasmid, pBacSC (containing cDNA encoding amino acids 810-3010 of HCV; see AAMO1680) was also constructed. Extracts of BacSS- or BacSB-infected Sf9 cells contain a novel magnesium-dependent content and corresponds to the input RNA molecule. As the products was shown to be dependent on the presence of RNA, but independent of an added primer or of the origin of the input RNA molecule. As the products cappeared to be identical, the experiments indicated that the observed RARD activity is encoded by the HCV NSSB protein. (Updated on 25-MAR-2003 CCC to correct PR field.) Radrago activity or the terminal nucleotidyl transferase (TNTase) activity or the terminal nucleotidyl transferase (TNTase) activity or the terminal nucleotidyl transferase (TNTase) activity or concernoded by hospatitis C virus (HCV), is characterised in that sequences concernoded by NSSB are used in the mixture. The method is used for assaying in viro the activities of RdRp and TNTase encoded by HCV in order to clentify, for therapeutic purposes, compounds that inhibit these enzymatic activities and therefore might interfere with the replication of the HCV. The present sequence comprises amino acids 810-3010 of the NC polyprotein and corresponds to NS2-NSSB procteins. CDNA encoding this protein mass cloned between the Ncol and HindIII sites of pBlueBacIII to form pBac25. Another expression plasmid, pBac5B (containing cDNA encoding amino acids 2420-3010 of HCV; see AAW01679) was also constructed.

Extracts of Bac25- or Bac5B-infected Sf9 cells contain a novel magnesium-dependent enzymatic activity that catalyses de novo RNA synthesis. This closendent of an added primer or of the presence of RNA, but condected a shown to be dependent on the presence of RNA, but condected that the observed RGRp activity is encoded by the HCV NSSB condected that the observed RGRp activity is encoded by the HCV NSSB protein. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 17-OCT 2003 to standardise OS field)

Antigenic polypeptides from the sequence can be used as immunoassay reagents, for screening donated blood, and as immunogens for vaccine prodn. Antibodies raised to the peptides can be used in immunoassays to detect or quantify NANBV antigens in liver tissue and blood. Preferred poly. Peptides include residues 1-30, -115, or 2012; 47-77; 116-191; 192-207 or -298; 230-238 or -263; 287-300; 293-330; 390-729; 730-1005; 1006-1614; 1384-1414; 1615-1862; 1737-1767; 1863-2012; and 2013-3010. The sequence is also disclosed in RP-4642879 (SEQ ID NO I). See AAR20091 for details of this specification. (Updated on 25-MAR-2003 to correct PD field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2420 SMSYTWIGALITPCAAEESKLPINALSNSLIRHHNWYYATTSRSAGLRQKKVYFDRLQVL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  65 DDHYRDVLKEMKAKASTVKAKLLSVEEACKLTPPHSAKSKFGYGAKDVRSLSSRAVNHIR

The sequence was deduced from several overlapping "BK" cDNA clones obtd. by "gene walking" using a cDNA clone isolated from a library prepd. from MANBAR NRA. Antigenic polypeptides from the sequence can be used as immunoassay reagents, for screening donated blood, and as immunogens for vaccine prodn. Antibodies raised to the peptides can be used in immunoassays to detect or quantify NANBV antigens in liver tissue and blood. Preferred polypeptides are include residues 1-30, -115, or 2012; 47-77; 116-191; 192-207 or -298; 230-218 or -263; 287-300; 293-330; 390-729; 730-1005; 1006-1614; 1384-1414; 1615-1862; 1737-1767; 1863-2012; and 2013-3010. The sequence is also disclosed in EP-46348 (SEQ ID NO 1) in which a virus particle contg. antigens encoded by the sequence is claimed. See AAR20111 for details of this specification. (Updated on 25-MAR-2003 to correct PA field.)
New DNA from non-A, non-B hepatitis virus - and derived antigenic polypeptide(s) useful for diagnostics, blood screening and in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2420 SMSYTWTGALITPCAAEESKLPINALSNSLLRHHNWYYATTSRSAGLRQKKVTFDRLQVL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the novel testing method for diagnosing liver cancer. The novel method comprises amplifying the amino terminal region of a hepatitis-C virus NS3 gene using a predetermined primer and determining the hepatitis-C virus in a base sequence of the obtained DNA fragment. The novel testing method is useful for diagnosing liver cancer and also used in a gene amplification technique, a clinical laboratory test reagent, a polymerase chain reaction, a base sequence analysis and genetic engineering. The method enables the detection of a hepatitis-C virus having high carcinogenicity with high specificity. This sequence represents the protein of the hepatitis-C virus NS3 gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DDHYRDVLKEMKAKASTVKAKLLSVEEACKLTPPHSAKSKFGYGAKDVRSLSSRAVNHIR

genotype 1b strain HC-J4 groune (see AAX24833). HC-J4 was obtained from acute phase plasma of a chimpanzee infected with serum containing HC-J4/91. The infectious nucleic acid sequence can be used to produce chimperic genomes (see AAX24833) consisting of the open reading frames of infectious nucleic acid sequences of other genotypes (including genotypes (including genotypes (including plants)). The invention also relates to the introduction of mutations or deletions into infectious nucleic acid sequences in order to produce an attenuated that with suitable for vaccine development. Infectious nucleic acid sequences can also be used to produce attenuated virus uitable for vaccine development. Infectious nucleic acid sequences can also be used to produce attenuated virus uitable for without any of the viruses produced by transfection of a host cell vitro or in vivo of the viruses produced by transfection of a host cell configuration in the infectious nucleic acid sequence are used to immunise mammals, especially humans, against hepatitis C. The nucleic configuration acid sequences can also be used to induce protective immunity against the virus. The nucleic acid sequences or their encoded proteases (e.g. NS3 protease) can additionally be used to develop screening assays to identify antiviral agents for HCV

The specification describes a nucleic acid comprising a chimeric virus genome, specifically bovine viral diarrhoea virus (BVDV) genome in which the fun-)structural region has been replaced by the fun-)structural region of a hepatitis C virus (HCV) genome. The nucleic acids comprising the chimeric virus and the chimeric virus are useful for identifying cell lines capable of supporting the replication of these chimeric viruses, in the production of HCV-BVDV virions, for the development of inactivated or attenuated vaccines to prevent HCV-BVDV in a mammal, in studying the molecular properties of HCV indirectly in vitro, and in identifying inhibitors of viral enzyme activity which would be useful as antiviral agents. Formulations or compositions comprising the chimeric virions may be used to treat or prevent the signs and symptoms of HCV. The present sequence is encoded by a HCV clone, which is used to construct chimeric concents.

The invention describes a polynucleotide vaccine comprising a polynucleotide sequence (S1) encoding the Hepatitis C virus (HCV) Core polynucleotide sequence (S1) encoding the Hepatitis C virus (HCV) Core protein and at least 1 other HCV protein, and causes expression of the proteins in cells (in which (S1) has been mutated or positioned relative to the polynucleotide sequence encoding the other HCV protein, so that the negative effect of the Core protein on expression of the other HCV protein is reduced). Also described are: a method of preventing the creating an HCV infection in a mammal, comprising administering the cacine cited above to a mammal; and a method of vaccination of an individual, comprising taking a polynucleotide vaccine as cited above, coating the polynucleotide onto gold beads and delivering the gold beads into the skin. HCV nucleic acids, polypeptides, host cells, vectors and antibodies used in the methods, are also disclosed. The polynucleotide vaccine is useful in the manufacture of a medicament for the treatment of HCV. This is the amino acid sequence of the wild type HCV polyprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New Hepatitis C virus (HCV) vaccine having a polynucleotide that encodes the polypeptide sequences of the HCV core and at least one other HCV protein, for use in medicine, particularly for manufacturing a medicament for treating HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DDHYRDYLKEMKAKASTVKAKLLSVBEACKLTPPHSAKSKFGYGAKDVRSLSSRAVNHIR 124

HCV DNA vaccines of the invention comprise a polymucleotide that encodes the HCV proteins Core. NS3, NS4B and NS5B, and does not encode the NS4A and/or NS5A proteins. Preferably, the codon usage of the polymucleotide sequence resembles that of highly expressed human genes. The polymucleotides may encode individual proteins or fusion proteins. Preferated fusions include double fusions between NS4B and NS5B and between Core and NS3. The vaccines are useful for the treatment or prevention of an HCV infection.

The invention describes a polynucleotide vaccine comprising a polynucleotide sequence (S1) encoding the Hepatitis C virus (HCV) Core protein and at least 1 other HCV protein, and causes expression of the proteins in cells (in which (S1) has been mutated or positioned relative to the polynucleotide sequence encoding the other HCV protein, so that the megative effect of the Core protein on expression of the other HCV protein is reduced) Also described are: a method of preventing or treating an HCV infection in a mammal, comprising administering the vaccine cited above to a mammal; and a method of vaccination of an individual, comprising taking a polynucleotide vaccine as cited above, coating the polynucleotide onto gold beads and delivering the gold beads into the skin. HCV nucleic acids, polypeptides, host cells, vectors and cantibodies used in the methods, are also disclosed. The polynucleotide vaccine is used in the manufacture of a medicament for the treatment of HCV. This is the amino acid sequence of the HCV NSSB protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     243
                                                     New Hepatitis C virus (HCV) vaccine having a polynucleotide that encodes the polypeptide sequences of the HCV core and at least one other HCV protein, for use in medicine, particularly for manufacturing a medicament
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    303

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (HCV). The sequence is the translation sequence of a polymucleotide in which codon usage was altered to resemble that of highly expressed human genes. HCV vaccines of the invention comprise a polymucleotide that encodes the HCV proteins Core, NS3, NS4B and NS5B, and does not encode the NS4A and/or NS5A proteins. The proteins may be expressed as individual proteins or as fusion proteins. Preferred fusions include double fusions between NS4B and NS5B and between Core and NS3. The vaccines are useful for the treatment or prevention of an HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

polypeptide, as predicted from CDMA (see AMX59394) containing the entire open reading frame of the NANBV genome. To obtain this cDNA, NANBV RNAs were extracted directly from NANBV genome. To obtain this cDNA, NANBV RNAs were extracted directly from NANBV genome. To obtain this cDNA, NANBV RNAs broadcaded liver of a patient having NANB hepatitis, or from a resected liver of a patient cancer. The RNA was then converted to double-stranded cDNA, A cDNA library was produced and screened using carum from a patient having chronic name patient having acute NANB hepatitis and serum from a patient having chronic NANB hepatitis. The isolated cDNA allows recombinant production of NANBV antigen polypeptides in microbial or antigens with high purity on a large scale at low cost without the biohazard associated with multiplying virus in animals. Claimed NANBV cucleotide sequences are useful for the recombinant production of polypeptides useful as antigens for vaccines, and as diagnostic reagents. (Updated on 20-MAR-2003 to New hepatitis virus polypeptides, useful for diagnosing and treating hepatitis infections. This sequence represents the non-A, non-B hepatitis virus (NANBV) Claim 2; Fig 2(1)-(16); 56pp; English WPI; 1999-407152/35. N-PSDB; AAX59394.

genome polyprotein - hepatitis C virus (isolate JK1)
N;Contains: capsid protein C; envelope protein M; hepacivirin (BC 3.4.21.98) (nonstructur)
Dyocein NS44; nonstructural protein NS4b; nonstructural protein NS5
C;Species: hepatitis C virus
A;Variety: isolate JK1
C;Date: 19-May-2000 #text_change 09-Jul-2004
C;Date: 19-May-2000 #text_change 09-Jul-2004
C;Accession: S18030; S33570; A48332; S18029
R;Honda, M.; Kaneko, S.; Masashi, U.; Kobayashi, K.; Murakami, S.
submitted to the EMBL Data Library, September 1991
A;Description: A whole genome of hepatitis C virus CDNA was isolated from a single patier A;Reference number: S18028
A;Accession: S18030
A;Molecule type: genomic RNA
A;Residues: 1-3010 <ARNA

                                                                                                                                                                                                               genome polyprotein - hepatitis C virus (strain HCV-1)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructu protein NS4s, nonstructural protein NS4s, nonstructural protein NS5s
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Accession: A39166; P00403; P00404

```
Genome polyprotein - hepatitis C virus (strain HC-J8)

N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructur)

N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructur)

protein N842; nonstructural protein NS4b; nonstructural protein NS5
C;Species: hepatitis C virus
C;Date: 31-Dec-1992 #sequence_revision 31-Dec-1992 #text_change 09-Jul-2004
C;Accession: A40250; PQ0397; PQ0859

NSS protein - hepatitis C virus (strain J4) (fragment)
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Date: 12-Peb-1993 #sequence_revision 12-Peb-1993 #text_change 09-Jul-2004
C;Accession: JQ0879
R;Okamoto, H.

RESULT 12

JQ0879

genome polyprotein - hepatitis C virus (isolate HC-J6)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructu
protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
C;Species: hepatitis C virus
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 09-Jul-2004
C;Accession: JQ1303
R;Okamoto, H.; Okada, S.; Sugiyama, Y.; Kurai, K.; Iizuka, H.; Machida, A.; Miyakawa, Y.
J. Gen. Virol. 72, 2697-2704, 1991
A;Title: Nucleotide sequence of the genomic RNA of hepatitis C virus isolated from a hum

Occupance polyprotein - hepatitis C virus (strain J6) (fragments)
NiContains: NSS protein
NiContains: NSS protein
Cispecies: hepatitis C virus
Cispecies: hepatitis
Cispeciption: The S'-terminal and 3'-terminal sequences of the genomic RNA A; Reference number: JQ0879
A; Reference number: JQ0879
A; Reference number: JQ0879
A; Recession: J0874 < CoKA-
A; Residues: l-874 < CoKA-
